

# SENIOR SCHOOL CERTIFICATE EXAMINATION MARCH-2014

## MARKING SCHEME – ECONOMICS (Outside) (SET - 3)

### Expected Answers / Value Points

#### GENERAL INSTRUCTIONS :

1. Please examine each part of a question carefully and allocate the marks allotted for the part as given in the marking scheme below. TOTAL MARKS FOR ANY ANSWER MAY BE PUT IN A CIRCLE ON THE LEFT SIDE WHERE THE ANSWER ENDS.
2. Expected suggested answers have been given in the Marking Scheme. To evaluate the answers the value points indicated in the marking scheme be followed.
3. For questions asking the candidate to explain or define, the detailed explanations and definitions have been indicated alongwith the value points.
4. For mere arithmetical errors, there should be minimal deduction. Only ½ mark be deducted for such an error.
5. Wherever only two / three or a “given” number of examples / factors / points are expected only the first two / three or expected number should be read. The rest are irrelevant and must not be examined.
6. There should be no effort at “moderation” of the marks by the evaluating teachers. The actual total marks obtained by the candidate may be of no concern to the evaluators.
7. Higher order thinking ability questions are assessing student’s understanding / analytical ability.
8.  indicates value based questions.

*General Note* : In case of numerical question no mark is to be given if only the final answer is given.

B3	Expected Answer / Value Points	Distribution of Marks
1	The cost which changes with change in output is called variable cost.	1
 2	It will increase inflow of foreign capital. Its economic value is the rise in production potential due to increase in resources.	1
3	Market supply of good is the sum total of quantities that all the producers of that good are willing to supply at a price during a period of time.	1
4	If in an oligopoly market the firms produce differentiated products, it is called imperfect oligopoly.	1

5	Monotonic preferences refers to a situation when consumption increases total utility also increases alongwith.	1									
6	$\text{Given } AR = \frac{TR}{Q}$ $\text{Since } TR = P \times Q$ $AR = \frac{P \times Q}{Q} = P$	3									
7	<p>Technological progress leads to reduction in cost of producing output. Price remaining unchanged, less cost means more profit. This increases supply of the good.</p> <p style="text-align: center;"><b>OR</b></p> <p>Suppose input prices rise. This raises cost. Price of the good remaining unchanged, profits fall. This discourages the producer so supply will decrease. Opposite happens if the input prices fall.</p>	3 3									
8	The main reason why the number of firms is small is that there are barriers which prevent entry of firms into industry. Patents, large capital requirement control over the crucial raw materials, etc. prevent new firms from entering the industry. Only those who are able to cross these barriers enter.	3									
9	A typical PP curve is downward sloping and concave, i.e. its slope is increasing, because marginal Rate of Transformation (MRT) increases as we move downwards along the curve. MRT increases because no resource is equally efficient in production of all goods. As the resources are transferred from one good to another MRT increases because less and less efficient resources are to be transferred each time.	3									
10	<table border="1"> <thead> <tr> <th><u>Price.</u></th> <th><u>Qty.</u></th> <th><u>Total exp.</u></th> </tr> </thead> <tbody> <tr> <td>10</td> <td>27</td> <td>270</td> </tr> <tr> <td>9</td> <td>30</td> <td>270</td> </tr> </tbody> </table> <p>Since with change in price total expenditure remains unchanged, price elasticity of demand is unitary i.e. equal to (-)1.</p> <p style="text-align: center;">(No mark if the percentage method is used)</p>	<u>Price.</u>	<u>Qty.</u>	<u>Total exp.</u>	10	27	270	9	30	270	1 2
<u>Price.</u>	<u>Qty.</u>	<u>Total exp.</u>									
10	27	270									
9	30	270									
11	Change in price of a complementary good affects the demand for the given good. Suppose X is the given good and Y is the complementary good. Suppose price of Y rises. This decreases demand for the complementary good Y. Since X and Y are used jointly, demand for X will also fall. It establishes inverse relation between price of the complementary good and demand for the given good.	4									
12	<p>The Law of Variable Proportions states that as only one input is increased, others remaining unchanged, Total Product (TP) changes in three phases.</p> <p><b>Phase : I</b> TP rises at an increasing rate.</p> <p><b>Phase : II</b> TP rises at decreasing rate</p> <p><b>Phase : III</b> TP falls</p>										

	<p><b>Reason :</b></p> <p><b>Phase : I</b> TP rises at an increasing rate because in the beginning as the quantity of the variable input is increased efficient utilization of fixed input takes places due to specialization. This raises efficiency of the variable input.</p> <p><b>Phase : II</b> TP now rises at a decreasing rate because as the variable input is increased, there is pressure on fixed inputs leading to decline in efficiency.</p> <p><b>Phase : III</b> TP starts falling because the quantity of the variable input becomes too much in relation to the fixed input.</p> <p style="text-align: center;"><b>(Diagram not required. To be marked as a whole. )</b></p>	<b>4</b>																														
<p><b>13</b></p>	<p>According to the utility analysis, the consumer is in equilibrium when</p> $\frac{MU_x}{P_x} = \frac{MU_y}{P_y}$ <p>Now, given that <math>P_x</math> rises, then</p> $\frac{MU_x}{P_x} < \frac{MU_y}{P_y}$ <p>Since per rupee <math>MU_x</math> is lower than per rupee <math>MU_y</math>, the consumer will buy less of X and more of Y.</p> <p>It shows that when <math>P_x</math> rises, demand for X falls.</p> <p style="text-align: center;"><b>OR</b></p> <p>While buying a unit of a good the consumer compares price with marginal utility (MU). So long as the price the consumer is willing to pay (i.e. MU) is higher than the market price, the consumer will go on buying. As the consumer buys more, MU falls due to the law of Diminishing Marginal Utility. The consumer stops buying when MU or Price he is willing to pay is equal to market price i.e. <math>MU = P</math>.</p> <p>If the consumer still buys more, MU will become lower than price; a position a rational consumer will not accept.</p>	<b>4</b>																														
<p><b>14</b></p>	<table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th>Output</th> <th>TR</th> <th>TC</th> <th>MR</th> <th>MC</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>6</td> <td>7</td> <td>6</td> <td>7</td> </tr> <tr> <td>2</td> <td>12</td> <td>13</td> <td>6</td> <td>6</td> </tr> <tr> <td>3</td> <td>18</td> <td>17</td> <td>6</td> <td>4</td> </tr> <tr style="border: 2px solid black;"> <td>4</td> <td>24</td> <td>23</td> <td>6</td> <td>6</td> </tr> <tr> <td>5</td> <td>30</td> <td>31</td> <td>6</td> <td>8</td> </tr> </tbody> </table> <p style="margin-left: 100px;">Equilibrium</p> <p>The producer is in equilibrium at 4 units of output</p> <p><b>Reason :</b> At this level of output the conditions of producers equilibrium given below are satisfied :</p> <p style="margin-left: 40px;">(1) <math>MC = MR</math></p> <p style="margin-left: 40px;">(2) <math>MC &gt; MR</math> after equilibrium</p> <p><b>Profit</b> = <math>TR - TC = 24 - 23 = 1</math></p>	Output	TR	TC	MR	MC	1	6	7	6	7	2	12	13	6	6	3	18	17	6	4	4	24	23	6	6	5	30	31	6	8	<b>2</b>

15

- $OP_1$  is the equilibrium price and  $OQ_1$  is equilibrium quantity. When demand increases, the demand curve shifts to the right.  $D_2$  is new demand curve.
- This creates an excess demand  $E_1A_1$  at the existing price  $OP_1$ .
- The excess demand causes competition among buyers resulting in rise in price .
- Rise in price leads to fall in demand and rise in supply as indicated by the arrows.
- These changes continue till the market reaches new equilibrium at  $E_2$  with a higher price  $OP_2$  and higher quantity  $OQ_2$ .

**For the Blind Candidate**

- Increase in demand result in excess demand
- It causes competition among buyers resulting in rise in price
- Price rise reduces demand and increases supply.
- Excess demand is reduce
- These changes continue till demand and supply are equal at new price.
- New price is higher than old price

16

(i) **Indifference Curve Slopes Downwards:** because in order to consume More units of X good the consumer must give up some quantity of Y good, so that consumer remains on the same level of satisfaction at each point of Indifference Curve.

(ii) **Indifference Curve is convex to the origin :** Because it is assumed that Marginal Rate of Substitution falls continuously as the consumer moves downwards along the curve. It is due to the Law of Diminishing Marginal Utility.

**OR**

Marginal Rate of Substitution (MRS) means the rate at which a consumer is willing to sacrifice quantity of one good to obtain one more unit of the other good.

3

3

1

	<p>Let the two goods consumed be A and B. Suppose the following combinations of these two goods have the same utility level for him :</p> <table border="0"> <thead> <tr> <th>Good A</th> <th>Good B</th> <th>MRS</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>8</td> <td>-</td> </tr> <tr> <td>2</td> <td>4</td> <td>4B : 1A</td> </tr> <tr> <td>3</td> <td>1</td> <td>3B : 1A</td> </tr> </tbody> </table> <p>The consumer is willing to sacrifice 4B to obtain second unit of A. For the third unit of A, he is willing to sacrifice less because marginal utility of A decreases as he consumes more of A.</p>	Good A	Good B	MRS	1	8	-	2	4	4B : 1A	3	1	3B : 1A	<p><b>3</b></p> <p><b>2</b></p>
Good A	Good B	MRS												
1	8	-												
2	4	4B : 1A												
3	1	3B : 1A												
	<b><u>SECTION - B</u></b>													
<b>17</b>	Excess demand refers to AD exceeding AS at the full employment level of income.	<b>1</b>												
<b>18</b>	When total government expenditure exceeds total government receipts excluding borrowing, the difference is called fiscal deficit.	<b>1</b>												
<b>19</b>	Managed floating exchange rate is flexible exchange rate which can be moderated by the intervention of the central bank through buying and selling of foreign currencies in the open market.	<b>1</b>												
<b>20</b>	Time deposits are deposits which have fixed period of maturity <b>Or</b> which can be withdrawn only after a specified period of time.	<b>1</b>												
<b>21</b>	Full employment is a situation in which all those who are able and willing to work at given wage rate find work.	<b>1</b>												
<b>22</b>	<b>(i) <u>Tax Receipts</u></b> are revenue receipts because these neither create any liability nor reduce asset.	<b>1 ½</b>												
	<b>(ii) <u>Disinvestments</u></b> are capital receipts because it reduces assets.	<b>1 ½</b>												
<b>23</b>	Appreciation of domestic currency means fall in the price of foreign currency in term of domestic currency. Fall in exchange rate mean exports becoming costlier for the foreign buyers because they will now get less goods and services for each unit of foreign currency. This will reduces demand for exports	<b>3</b>												
<b>24</b>	Externalities refer to the benefits (or harms) a firm or an individual causes to another for which it is not paid (or penalised)	<b>1</b>												
	<b>Example :</b> Use of public parks by the people for pleasure for which no payments are made by the public (or any other example). It increases welfare through positive effect on health.	<b>2</b>												
<b>25</b>	The unit of account function means that monetary unit is treated as the standard unit for quoting prices or borrowing & lending activities etc. This function has made possible keeping of accounts and the emergence of the banking system.	<b>3</b>												

	<b>OR</b>	
	Deferred payments mean payment contracted to be made at some future date. Money serves as a standard of such deferred payments, like in borrowing and lending activities. It has made possible the creation of banking system.	<b>3</b>
<b>26</b>	Autonomous transactions are those which are not influenced by other transactions in Balance of Payment Account. Accommodating transactions are those which are undertaken to cover deficit / Surplus in BOP.	<b>3</b>
<b>27</b>	$Y = \bar{C} + MPC(Y) + I$ $500 = \bar{C} + (1 - 0.3)500 + 100$ $\bar{C} = 500 - 350 - 100 = 50$ <p style="text-align: right;">(No marks if only the final answer is given)</p>	<b>1½</b> <b>1½</b> <b>1</b>
<b>28</b>	This will reduce the inequalities of income as the difference between disposable incomes of higher income and lower income groups will fall. This will also provide more resource to the government for spending on welfare of the poor-	<b>4</b>
<b>29</b>	Central bank is banker to the government like commercial banks are to the public. It accepts deposits from government and gives loans to the government in times of need.	<b>4</b>
	<b>OR</b>	
	Commercial banks are required to keep a certain minimum percentage of deposits as cash reserve with the central bank. Central bank user these reserves to meet emergency requirements of the commercial banks. It is called bankers' bank functions of the central bank.	<b>4</b>
<b>30</b>	<p><b>(i) <u>Taking care of aged parents</u></b> Should be included because it is a productive service rendered to the parents.</p> <p><b>(ii) <u>Payments of corporation tax</u></b> should not be included because any tax payment is a transfer payment as no good or service is provided in return</p> <p><b>(iii) <u>Expenditure on providing police services by government</u></b> should be included because expenditure on any free service provided by government is government's final consumption expenditure.</p> <p style="text-align: right;">(No marks if the reason is not given)</p>	<b>2</b>  <b>2</b>  <b>2</b>
<b>31</b>		<b>2</b>

The economy is in equilibrium at that income level at which saving = investment.  
The equilibrium level of income is OM as at this level S=I

1

When the economy is not in equilibrium saving is not equal to investment :  
Suppose  $S > I$ . It means  $AD < AS$ . This leads to piling up of inventories with the producers. In order to bring down inventories to the desired level , producers cut down production which brings down AS. The trend continues till  $AD = AS$  again and  $S = I$  where the economy is in equilibrium. Similarly if  $S < I$ , then  $AD > AS$ . There is decrease in inventories. Producers increase production, AS rises. This continues till  $AD = AS$ .

3

OR

3

**Steps :**

- (i)  $SS'$  is the given S- Curve. Draw a  $45^\circ$  line from origin
- (ii) Take  $O\bar{C}$  equal to OS on the Y-axis.
- (iii) Draw a perpendicular (or line parallel to the y-axis) from  $B_1$  till it intersects the  $45^\circ$  line at B.
- (iv) Join  $\bar{C}$  and B and extend the same to get C-curve

3

**For the Blind Candidates :**

- Definition of Investment.
- Equilibrium on the same lines as above without diagram
- When not in equilibrium on the same line as above

1

2

3

OR

- Definition of consumption function.
- Derivation with explanation.
