NCERT Solutions Class 11 Physics chapter 10 Mechanical Properties of Fluids <u>Mechanical Properties of Fluids</u>

ExerciseP.272

Q.10.1: Explain why

- (a) The blood pressure in humans is greater at the feet than at the brain
- (b) Atmospheric pressure at a height of about 6 km decreases to nearly half of its value at the sea level, though the height of the atmosphere is more than 100 km
- (c) Hydrostatic pressure is a scalar quantity even though pressure is force divided by area.

Ans: (a) The pressure Of a liquid is given by the relation:

p = hpq

where,

p = Pressure

h = Height of the liquid column

p = Density of the liquid

g = Acceleration due to the gravity

It can be inferred that pressure is directly proportional to height. Hence, the blood

pressure in human vessels depends on the height Of the blood column in the body. The

height Of the blood column is more at the feet than it is at the brain.

Hence, the blood

pressure at the feet is more than it is at the brain.

(b) Density of air is the maximum near the sea level. Density of air decreases with

increase in height from the surface. At a height of about 6 km, density decreases to

nearly half of its value at the sea level. Atmospheric pressure is proportional to density.

Hence, at a height of 6 km from the surface, it decreases to nearly half of its value at the sea level.

(c) When force is applied on a liquid, the pressure In the liquid is transmitted in all

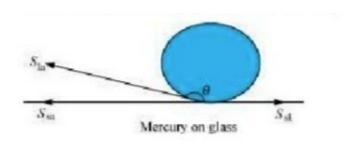

directions. Hence, hydrostatic pressure does not have a fixed direction and it is a scalar

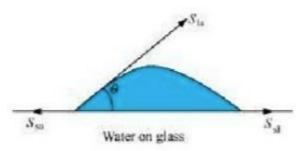

physical quantity.

Q.10.2: Explain why

- (a) The angle of contact of mercury with glass is obtuse, while that of water with glass is acute.
- (b) Water on a clean glass surface tends to spread out while mercury on the same surface tends to form drops. (Put differently, water wets glass while mercury does not.)
- (c) Surface tension of a liquid is independent of the area of the surface
- (d) Water with detergent dissolved in it should have small angles of contact.
- (e) A drop of liquid under no external forces is always spherical in shape

Ans: (a) The angle between the tangent to the liquid surface at the point of contact and the surface inside the liquid is called the angle of contact (B), as shown in the given figure.

S lat S sat and S sl are the respective interfacial tensions between the liquid-air, solid-air, and solid-liquid interfaces. At the line of contact, the surface forces between the three media must be in equilibrium,

i.e., S lat S sat and S sl are the respective interfacial tensions between the liquid-air, solid-air, and solid-liquid interfaces. At the line of contact, the surface forces between the three media must be in equilibrium, i.e., $\cos\theta = Sa - SslSla\cos\theta = Sa - SslSla$

Q.10.3: Fill in the blanks using the word(s) from the list appended with each statement:

- (a) Surface tension of liquids generally ... with temperatures (increases / decreases)
- (b) Viscosity of gases ... with temperature, whereas viscosity of liquids ... with temperature (increases / decreases)
- (c) For solids with elastic modulus of rigidity, the shearing force is proportional to ..., while for fluids it is proportional to ... (shear strain / rate of shear strain)
- (d) For a fluid in a steady flow, the increase in flow speed at a constriction follows (conservation of mass / Bernoulli's principle)
- (e) For the model of a plane in a wind tunnel, turbulence occurs at a ... speed for turbulence for an actual plane (greater / smaller)

Ans: (a) decreases

The surface tension of a liquid is inversely proportional to temperature.

(b) increases; decreases

Most fluids Offer resistance to their motion. This is like internal mechanical friction,

known as viscosity. Viscosity Of gases increases with temperature, while viscosity Of

liquids decreases with temperature.

(c) Shear strain; Rate of shear strain

With reference to the elastic modulus of rigidity for solids, the shearing force is

proportional to the shear strain. With reference to the elastic modulus of rigidity for

Downloaded from FreeHomeDelivery.net

fluids, the shearing force is proportional to the rate of shear strain. **Q.10.4**: Explain why

- (a) To keep a piece of paper horizontal, you should blow over, not under, it
- (b) When we try to close a water tap with our fingers, fast jets of water gush through the openings between our fingers
- (c) The size of the needle of a syringe controls flow rate better than the thumb pressure exerted by a doctor while administering an injection
- (d) A fluid flowing out of a small hole in a vessel results in a backward thrust on the vessel
- (e) A spinning cricket ball in air does not follow a parabolic trajectory
- **Ans:** (a) When air is blown under a paper, the veloc ty Of air is greater under the paper than it is above it. As per Bernoulli's principle, atmospheric pressure reduces under the paper. This makes the paper fall. To keep a piece of paper horizontal, one should blow over it, This increases the velocity of air above the paper. As per Bernoulli's principle, atmospheric pressure reduces above the paper and the paper remains horizontal.
- (b) According to the equation of continuity: Area x Velocity = Constant For a smaller opening, the velocity Of flow Of a fluid is greater than it is when the
- opening is bigger. When we try to close a tap Of water with our fingers, fast jets Of water gush through the openings between our fingers, This is because very small openings are left for the water to flow out of the pipe. Hence, area and velocity are inversely proportional to each other.
- (c) The small opening Of a syringe needle controls the velocity Of the blood flowing Out.

This is because Of the equation Of continuity. At the constriction point Of the syringe

system, the flow rate suddenly increases to a high value for a constant thumb pressure applied.

(d) When a fluid flows out from a small hole in a vessel, the vessel receives a backward

thrust. A fluid flowing out from a small hole has a large velocity according to the

equation of continuity: Area x Velocity Constant According to the law of conservation of momentum, the vessel attains a backward velocity because there are no external forces acting on the system.

(e) A spinning cricket ball has two simultaneous motions — rotary and linear. These

two types of motion oppose the effect of each other. This decreases the velocity of air

flowing below the ball. Hence, the pressure on the upper side of the ball becomes lesser

than that on the lower side. An upward force acts upon the ball.

Therefore, the ball takes

a curved path. It does not follow a parabolic path.

Q.10.5: A 50 kg girl wearing high heel shoes balances on a single heel. The heel is circular with a diameter 1.0 cm. What is the pressure exerted by the heel on the horizontal floor?

Ans: Mass of the girl, m=50kg Diameter of the

heel, d=1cm=0.01m Radius of the heel, r=d2=0.005m Mass of the girl, m=50kg Diameter of the heel, d=1cm=0.01m Radius of the heel, r=d2=0.005m

Area of the heel $=\pi r2=\pi(0.005)2=7.85\times10-5m2$ Force exerted by the heel on the floor: F=mg Area of the

heel $=\pi r^2 = \pi(0.005)^2 = 7.85 \times 10 - 5m^2$ Force exerted by the heel on the floor: F=mg

 $=50\times9.8=490$ N Pressure exerted by the heel on the

floor: P= Force Area = $50 \times 9.8 = 490$ N Pressure exerted by the heel on the floor: P= Force Area

 $=4907.85\times10-5=6.24\times106$ Nm-2 Therefore, the pressure exerted by the heel on the horizontal floor

is $6.24 \times 106 \text{Nm} - 2 = 4907.85 \times 10 - 5 = 6.24 \times 106 \text{Nm} - 2$ Therefore, the pressure exerted by the heel on the horizontal floor is $6.24 \times 106 \text{Nm} - 2$

Q.10.19: What is the pressure inside the drop of mercury of radius 3.00 mm at room temperature? Surface tension of mercury at that temperature (20 °C) is $4.65 \times 10-110-1$ N m-1m-1. The atmospheric pressure is 1.01×105105 Pa. Also give the excess pressure inside the drop.

Ans: 1.01×105Pa;310Pa Radius of the mercury

drop, r=3.00mm= $3\times10-3$ m Surface tension of

mercury, $S=4.65\times10-1$ Nm-1 Atmospheric

pressure, P0=1.01×105Pa Total pressure inside the mercury

drop = Excess pressure inside mercury + Atmospheric

pressure 1.01×105Pa;310Pa Radius of the mercury

drop, r=3.00mm= $3\times10-3$ m Surface tension of

mercury, $S=4.65\times10-1$ Nm-1 Atmospheric

pressure, P0=1.01×105Pa Total pressure inside the mercury

drop = Excess pressure inside mercury + Atmospheric pressure

 $=2Sr+P0=2\times4.65\times10-13\times10-3+1.01\times105=1.0131\times105=1.01\times105$ Pa

pressure = $2Sr=2Sr+P0=2\times4.65\times10-13\times10-3+1.01\times105=1.0131\times105$ = 1.01×105 Pa Excess pressure =2Sr

Q.10.6: Torricelli's barometer used mercury. Pascal duplicated it using French wine of density 984 kg m-3m-3. Determine the height of the wine column for normal atmospheric pressure.

Ans : 10.5m Density of mercury, $\rho 1=13.6\times103$ kg/m3 Height of the mercury column, h1=0.76m3 Density of French

wine, ρ 2=984kg/m3 Height of the French wine column =h2 Acceleration due to gravity, g=9.8m/s210.5m Density of

mercury, $\rho 1=13.6\times103$ kg/m3 Height of the mercury

column, h1=0.76m3 Density of French wine, $\rho2=984kg/m3$ Height of the French wine column =h2 Acceleration due to gravity, q=9.8m/s2

The pressure in both the columns is equal, i.e., Pressure in the mercury column = Pressure in the French wine

column $\rho1h1g=\rho2h2gh2=\rho1h1\rho2$ The pressure in both the columns is equal, i.e., Pressure in the mercury column = Pressure in the French wine column $\rho1h1g=\rho2h2gh2=\rho1h1\rho2$

 $=13.6\times103\times0.76984=10.5$ m Hence, the height of the French wine column for normal atmospheric pressure

is 10.5m.= $13.6 \times 103 \times 0.76984 = 10.5$ m Hence, the height of the French wine column for normal atmospheric pressure is 10.5m.

Q.10.7: A vertical offshore structure is built to withstand a maximum stress of 109 Pa. Is the structure suitable for putting up on top of an oil well in the ocean? Take the depth of the ocean to be roughly 3 km, and ignore ocean currents.

Ans: Yes The maximum allowable stress for the structure, P=109 Pa Depth of the ocean, d=3km=3×103m Density of water, ρ =103kg/m3 Acceleration due to gravity, g=9.8m/s2 The pressure exerted because of the sea water at depth, d=pdg Yes The maximum allowable stress for the structure, P=109 Pa Depth of the ocean, d=3km=3×103m Density of water, ρ =103kg/m3 Acceleration due to gravity, g=9.8m/s2 The pressure exerted because of the sea water at depth, d=pdg

 $=3\times103\times103\times9.8=2.94\times107$ Pa The maximum allowable stress for the structure (109Pa) is greater than the pressure of the sea water (2.94×107 Pa). The pressure exerted by the ocean is less than the pressure that the structure can withstand. Hence, the structure is suitable for putting up on top of an oil well in the ocean. $=3\times103\times103\times9.8=2.94\times107$ Pa The maximum allowable stress for the structure (109Pa) is greater than the pressure of the sea water (2.94×107 Pa). The pressure exerted by the ocean is less than the pressure that the structure can withstand. Hence, the structure is suitable for putting up on top of an oil well in the ocean.

Q.10.8: A hydraulic automobile lift is designed to lift cars with a maximum mass of 3000 kg. The area of cross-section of the piston carrying the load is 425 cm2cm2. What maximum pressure would the smaller piston have to bear?

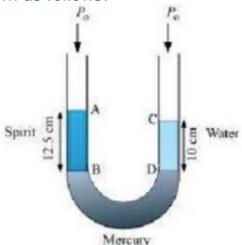

Ans: The maximum mass of a car that can be lifted, m=3000kg Area of cross-section of the load-carrying piston, A=425cm2=425×10–4m2 The maximum force exerted by the load, F=mg=3000×9.8=29400N The maximum mass of a car that can be lifted, m=3000kg Area of cross-section of the load-carrying piston, A=425cm2=425×10–4m2 The maximum force exerted by the load, F=mg=3000×9.8=29400N The maximum pressure exerted on the load-carrying piston, P=FA=29400425×10–4=6.917×105Pa Pressure is transmitted agraphy in all directions in a liquid. Therefore, the maximum pressure that

piston, $P=FA=29400425\times10-4=6.917\times105Pa$ Pressure is transmitted equally in all directions in a liquid. Therefore, the maximum pressure that the smaller piston would have to bear is 6.917×105 Pa. The maximum pressure exerted on the load-carrying

piston, $P=FA=29400425\times10-4=6.917\times105Pa$ Pressure is transmitted equally in all directions in a liquid. Therefore, the maximum pressure that the smaller piston would have to bear is 6.917×105 Pa.

Q.10.9: A U-tube contains water and methylated spirit separated by mercury. The mercury columns in the two arms are in level with 10.0 cm of water in one arm and 12.5 cm of spirit in the other. What is the specific gravity of spirit?

Ans: The given system of water, mercury, and methylated spirit is +10wn as follows:

Height of the spirit column, h1=12.5cm=0.125m Height of the water column, h2=10cm=0.1mP0= Atmospheric pressure $\rho1=$ Density of spirit $\rho2=$ Density of water Height of the spirit

column, h1=12.5cm=0.125m Height of the water

column, h2=10cm=0.1mP0= Atmospheric pressure $\rho1=$ Density of spirit $\rho2=$ Density of water

Pressure at point $B=P0+h1\rho1g$ Pressure at point $D=P0+h2\rho2g$ Pressure at points B and D is the

same. $P0+h1\rho1g=h2\rho2g\rho1\rho2=h2h1\rho1\rho2=h2h1=1012.5=0.8$ Pressure at point B=P0+h1p1g Pressure at point D=P0+h2p2g Pressure at points B and D is the

same. $P0+h1\rho1g=h2\rho2g\rho1\rho2=h2h1\rho1\rho2=h2h1=1012.5=0.8$ Therefore, the specific gravity of spirit is 0.8.

Q.10.10: In the previous problem, if 15.0 cm of water and spirit each are further poured into the respective arms of the tube, what is the difference in the levels of mercury in the two arms ? (Specific gravity of mercury = 13.6)

Ans: Height of the water column, h1=10+15=25cm Height of the spirit column, h2=12.5+15=27.5cm Density of water, $\rho1=1$ gcm-3 Density of spirit, $\rho2=0.8$ gcm-3 Density of mercury =13.6gcm-3 Let h be the difference between the levels of mercury in the two arms Height of the water column, h1=10+15=25cm Height of the spirit column, h2=12.5+15=27.5cm Density of water, $\rho1=1$ gcm-3 Density of

spirit, p2=0.8gcm-3 Density of mercury =13.6gcm-3 Let h be the difference between the levels of mercury in the two arms

Pressure exerted by height h, of the mercury column: $=h\rho g=h\times 13.6g...$

- (i) Difference between the pressures exerted by water and spirit: Pressure exerted by height h, of the mercury column: $=hpg=h\times13.6g...$
- (i) Difference between the pressures exerted by water and spirit: $=h1\rho1g-h1\rho1g=g(25\times1-27.5\times0.8)=3g...$
- (ii)= $h1\rho1g-h1\rho1g=g(25\times1-27.5\times0.8)=3g...(ii)$

Equating equations (i) and (ii), we

get: 13.6hg=3gh=0.220588≈0.221cm Hence, the difference between the levels of mercury in the two arms is 0.221cm Equating

equations (i) and (ii), we get: 13.6hg=3gh=0.220588≈0.221cm Hence, the difference between the levels of mercury in the two arms is 0.221cm **Q.10.11**: Can Bernoulli's equation be used to describe the flow of water through a rapid in a river? Explain.

Ans: NO

Bernoulli's equation cannot be used to describe the flow Of water through a rapid in a

river because Of the turbulent flow Of water. This principle can only be applied to a

streamline flow.

Q.10.12: Does it matter if one uses gauge instead of absolute pressures in applying Bernoulli's equation? Explain

Ans: No

It does not matter if one uses gauge pressure instead of absolute pressure while

applying Bernoulli's equation. The two points where Bernoulli's equation is applied should have significantly different atmospheric pressures.

Q.10.13: Glycerine flows steadily through a horizontal tube of length 1.5 m and radius 1.0 cm. If the amount of glycerine collected per second at one end is $4.0 \times 10-310-3$ kg s-1s-1, what is the pressure difference between the two ends of the tube? (Density of glycerine = 1.3×103 kg m-3m-3 and viscosity of glycerine = 0.83 Pa s). [You may also like to check if the assumption of laminar flow in the tube is correct].

Ans: 9.8×102 Pa Length of the horizontal tube, I=1.5m Radius of the tube, r=1cm=0.01m Diameter of the tube, d=2r=0.02m Glycerine is flowing at a rate of $4.0\times10-3$ kgs-1M= $4.0\times10-3$ kgs-19.8×102Pa Length of the horizontal tube, I=1.5m Radius of the

tube, r=1cm=0.01m Diameter of the tube, d=2r=0.02m Glycerine is flowing at a rate of $4.0\times10-3kgs-1M=4.0\times10-3kgs-1$

Density of glycerine, $\rho=1.3\times103$ kgm-3 viscosity of

glycerine, η =0.83Pa s Volume of glycerine flowing per sec: V=Mp Density of glycerine, ρ =1.3×103kgm-3 viscosity of

glycerine, η =0.83Pa s Volume of glycerine flowing per sec: V=Mp =4.0×10-31.3×103=3.08×10-6m3s-1 According to Poiseville's formula, we have the relation for the rate of

flow: $=4.0\times10-31.3\times103=3.08\times10-6$ m3s-1 According to Poiseville's formula, we have the relation for the rate of flow:

V=πpr48nl Where, p is the pressure difference between the two ends of the tube \therefore p=V8nlπr4V=πpr48nl Where, p is the pressure difference between the two ends of the tube \therefore p=V8nlπr4

 $=3.08\times10-6\times8\times0.83\times1.5\pi\times(0.01)4=9.8\times102$ Pa Reynolds' number is given by the

relation: $=3.08\times10-6\times8\times0.83\times1.5\pi\times(0.01)4=9.8\times102$ Pa Reynolds' number is given by the relation:

R=4 ρ V π d η =4 \times 1.3 \times 103 \times 3.08 \times 10 -6π \times (0.02) \times 0.83=0.3 Reynolds' number is about 0.3. Hence, the flow is

laminar. R= $4\rho V \pi d\eta = 4 \times 1.3 \times 103 \times 3.08 \times 10 - 6\pi \times (0.02) \times 0.83 = 0.3$ Reynold s' number is about 0.3. Hence, the flow is laminar.

Q.10.14: In a test experiment on a model aeroplane in a wind tunnel, the flow speeds on the upper and lower surfaces of the wing are 70 m s–1s–1and 63 m s–1s–1 respectively. What is the lift on the wing if its area is 2.5 m2m2? Take the density of air to be 1.3 kg m–3m–3 .

Ans: Speed of wind on the upper surface of the wing, V1=70m/s Speed of wind on the lower surface of the wing, V2=63m/s Area of the wing, A=2.5m2 Density of air, ρ =1.3kgm-3 According to Bernoulli's theorem, we have the relation: Speed of wind on the upper surface of the wing, V1=70m/s Speed of wind on the lower surface of the wing, V2=63m/s Area of the wing, A=2.5m2 Density of air, ρ =1.3kgm-3 According to Bernoulli's theorem, we have the relation: P1+12pV21=P2+12pV22P2-P1=12p(V21-V22) Where, P1= Pressure on the upper surface of the

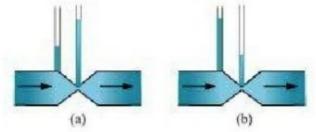

wing P1+12 ρ V12=P2+12 ρ V22P2-P1=12 ρ (V12-V22) Where, P1= Pressur e on the upper surface of the wing

P2= Pressure on the lower surface of the wing The pressure difference between the upper and lower surfaces of the wing provides lift to the aeroplane. Lift on the wing =(P2-P1)A=12 ρ (V21-V22)AP2= Pressure on the lower surface of the wing The pressure difference between the upper and lower surfaces of the wing provides lift to the aeroplane. Lift on the wing =(P2-P1)A=12 ρ (V12-V22)A

 $=121.3((70)2-(63)2)\times2.5=1512.87=1.51\times103N$ Therefore, the lift on the wing of the aeroplane

is 1.51×103 N= $121.3((70)2-(63)2) \times 2.5=1512.87=1.51 \times 103$ N Therefore, the lift on the wing of the aeroplane is 1.51×103 N

Q.10.15: Figures 10.23(a) and (b) refer to the steady flow of a (non-viscous) liquid. Which of the two figures is incorrect? Why?

Ans: (a) Take the case given in figure (b). (a) Take the case given in figure (b).

Where, A1= Area of pipel A2= Area of pipe 2V2= Speed of the fluid in pipe 2V2= Speed of the fluid in pipe 2 From the law of continuity, we have: Where, A1= Area of pipel A2= Area of pipe 2V2= Speed of the fluid

in pipe 2V2= Speed of the fluid in pipe 2 From the law of continuity, we have:

A1V1=A2V2 When the area of cross-section in the middle of the venturimeter is small, the speed of the flow of liquid through this part is more. According to Bernoulli's principle, if speed is more, then pressure is less. A1V1=A2V2 When the area of cross-section in the middle of the venturimeter is small, the speed of the flow of liquid through this part is more. According to Bernoulli's principle, if speed is more, then pressure is less.

Pressure is directly proportional to height. Hence, the level of water in pipe 2 is less. Therefore, figure (a) is not possible. Pressure is directly proportional to height. Hence, the level of water in pipe 2 is less. Therefore, figure (a) is not possible.

Q.10.16: The cylindrical tube of a spray pump has a cross-section of 8.0 cm2cm2 one end of which has 40 fine holes each of diameter 1.0 mm. If the liquid flow inside the tube is 1.5 m min-1min-1, what is the speed of ejection of the liquid through the holes?

Ans: Area of cross-section of the spray

pump, A1=8cm2=8×10-4m2 Number of holes, n=40 Diameter of each hole, d=1mm=1×10-3m Radius of each hole, r=d/2=0.5×10-3m Area of cross-section of each hole, a= π r2= π (0.5×10-3)2m2 Area of cross-section of the spray pump, A1=8cm2=8×10-4m2 Number of

holes, n=40 Diameter of each hole, d=1mm=1 \times 10-3m Radius of each hole, r=d/2=0.5 \times 10-3m Area of cross-section of each hole, a= π r2= π (0.5 \times 10-3)2m2

Total area

of 40 holes, A2= $n \times a = 40 \times \pi (0.5 \times 10 - 3)2m2 = 31.41 \times 10 - 6m2$ Speed of flow of liquid inside the tube, V1=1.5m/min=0.025m/s Speed of ejection of liquid through the holes =V2 According to the law of continuity, we have: Total area

of 40 holes, $A2=n\times a=40\times \pi (0.5\times 10-3)2m2=31.41\times 10-6m2$ Speed of flow of liquid inside the tube, V1=1.5m/min=0.025m/s Speed of ejection of liquid through the holes =V2 According to the law of continuity, we have:

 $A1V1=A2V2V2=A1V1A2=8\times10-\times0.02531.61\times10-6=0.633$ m/s $A1V1=A2V2V2=A1V1A2=8\times10-\times0.02531.61\times10-6=0.633$ m/s

Therefore, the speed Of ejection Of the liquid through the holes is O. 633 m/s.

Q.10.17: A U-shaped wire is dipped in a soap solution, and removed. The thin soap film formed between the wire and the light slider supports a weight of $1.5 \times 10-210-2$ N (which includes the small weight of the slider). The length of the slider is 30 cm. What is the surface tension of the film?

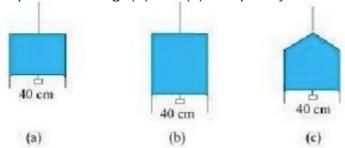

Ans: The weight that the soap film supports, W=1.5×10–2N Length of the slider, I=30cm=0.3m A soap film has two free surfaces. \therefore Total length =2I=2×0.3=0.6m The weight that the soap film supports, W=1.5×10–2N Length of the slider, I=30cm=0.3m A soap film has two free surfaces. \therefore Total length =2I=2×0.3=0.6m

S= Force or Weight 2I Surface

tension, = $1.5 \times 10 - 20.6 = 2.5 \times 10 - 2$ N/m Therefore, the surface tension of the film is $2.5 \times 10 - 2$ Nm-1S= Force or Weight 2I Surface

tension, = $1.5 \times 10 - 20.6 = 2.5 \times 10 - 2$ N/m Therefore, the surface tension of the film is $2.5 \times 10 - 2$ Nm-1

Q.10.18: Figure 10.24 (a) shows a thin liquid film supporting a small weight = $4.5 \times 10-210-2$ N. What is the weight supported by a film of the same liquid at the same temperature in Fig. (b) and (c)? Explain your answer physically.

Ans: Take case (a): The length of the liquid film supported by the weight, I=40cm=0.4cm The weight supported by the film, W=4.5×10−2N A liquid film has two free surfaces. Take case (a): The length of the liquid film supported by the weight, I=40cm=0.4cm The weight supported by the film, W=4.5×10−2N A liquid film has two free surfaces. ∴ Surface tension =W2I=4.5×10−22×0.4=5.625×10−2Nm−1 In all the

∴ Surface tension =W2I=4.5×10−22×0.4=5.625×10−2Nm−1 In all the three figures, the liquid is the same. Temperature is also the same for each case. Hence, the surface tension in figure (b) and figure (c) is the same as in figure (a), i.e., $5.625\times10-2Nm-1$. Surface tension =W2I=4.5×10−22×0.4=5.625×10−2Nm−1 In all the three figures, the liquid is the same. Temperature is also the same for each case. Hence, the surface tension in figure (b) and figure (c) is the same as in figure (a), i.e., $5.625\times10-2Nm-1$.

since the length of the film in all the cases is 40cm, the weight supported in each case is $4.5 \times 10 - 2N$. since the length of the film in all the cases is 40cm, the weight supported in each case is $4.5 \times 10 - 2N$.

Q.10.20: What is the excess pressure inside a bubble of soap solution of radius 5.00 mm, given that the surface tension of soap solution at the temperature (20 °C) is $2.50 \times 10-210-2$ N m-1m-1? If an air bubble of the same dimension were formed at depth of 40.0 cm inside a container containing the soap solution (of relative density 1.20), what would be the pressure inside the bubble? (1 atmospheric pressure is 1.01×105105 Pa)

Ans : Excess pressure inside the soap bubble is 20Pa; Pressure inside the air bubble is 1.06×105 Pa Soap bubble is of radius, r=5.00mm= $5 \times 10-3$ m Surface tension of the soap solution, $S=2.50 \times 10-2$ Nm-1 Relative density of the soap solution = $1.20 \times 10-2$ Nm-1 Excess pressure inside the soap bubble is 20Pa; Pressure inside the air bubble is 1.06×105 Pa Soap bubble is of radius, r=5.00mm= $5 \times 10-3$ m Surface tension of the soap solution, $S=2.50 \times 10-2$ Nm-1 Relative density of the soap solution = $1.20 \times 10-2$ Nm-1

```
\therefore Density of the soap solution, \rho=1.2\times103kg/m3 Air bubble formed at a
depth, h=40cm=0.4m Radius of the air
bubble, r=5mm=5\times10-3m1 atmospheric
pressure =1.01 \times 105Pa Acceleration due to gravity, g=9.8m/s2 Hence, the
excess pressure inside the soap bubble is given by the relation: : Density
of the soap solution, \rho=1.2\times103kg/m3 Air bubble formed at a
depth, h=40cm=0.4m Radius of the air
bubble, r=5mm=5\times10-3m1 atmospheric
pressure = 1.01 \times 105Pa Acceleration due to gravity, g=9.8m/s2 Hence, the
excess pressure inside the soap bubble is given by the relation:
P=4Sr=4\times2.5\times10-25\times10-3=20PaP=4Sr=4\times2.5\times10-25\times10-3=20Pa
Therefore, the excess pressure inside the soap bubble is 20 Pa. The
excess pressure inside the air bubble is given by the relation: Therefore,
the excess pressure inside the soap bubble is 20 Pa. The excess pressure
inside the air bubble is given by the relation:
P'=2Sr=2\times2.5\times10-25\times10-3=10PaP'=2Sr=2\times2.5\times10-25\times10-3=10Pa
Therefore, the excess pressure inside the air bubble is 10 Pa. At a depth
of 0.4m, the total pressure inside the air bubble = Atmospheric
pressure +hpg+P
'=1.01\times105+0.4\times1.2\times103\times9.8+10=1.057\times105Pa=1.06×105Pa Therefor
e, the excess pressure inside the air bubble is 10 Pa. At a depth
of 0.4m, the total pressure inside the air bubble = Atmospheric
pressure +hpq+P
'=1.01\times105+0.4\times1.2\times103\times9.8+10=1.057\times105Pa=1.06\times105Pa
Therefore, the pressure inside the air bubble is 1.06 \times 105 Pa1.06 \times 105 Pa
Additional ExercisesP.274
Q.10.21: A tank with a square base of area 1.0 m2m2 is divided by a vertical
partition in the middle. The bottom of the partition has a small-hinged door of area 20
cm2cm2. The tank is filled with water in one compartment, and an acid (of relative
density 1.7) in the other, both to a height of 4.0 m. compute the force necessary to
keep the door close.
Ans: Base area of the given tank, A=1.0m2 Area of the hinged
door, a=20cm2=20\times10-4m2 Density of water, \rho1=103kg/m3 Density of
acid, \rho 2=1.7\times103kg/m3 Height of the water column, h1=4m Base area of
the given tank, A=1.0m2 Area of the hinged
door, a=20cm2=20×10-4m2 Density of water, p1=103kg/m3 Density of
acid, \rho 2=1.7\times103kg/m3 Height of the water column, h1=4m
Height of the acid column, h2=4m Acceleration due to
gravity, g=9.8 Pressure due to water is given as: P1=h1p1g Height of the
acid column, h2=4m Acceleration due to gravity, q=9.8 Pressure due to
water is given as: P1=h1o1g
=4\times103\times9.8=3.92\times104Pa Pressure due to acid is given
as: P2=h2\rho2g=4\times1.7\times103\times9.8=6.664\times104Pa Pressure difference
between the water and acid columns: =4\times103\times9.8=3.92\times104Pa Pressure
due to acid is given
as: P2=h2o2g=4\times1.7\times103\times9.8=6.664\times104Pa Pressure difference
```

between the water and acid columns:

 $\Delta P=P2-P1=6.664\times104-3.92\times104=2.744\times104Pa$ Hence, the force exerted on the

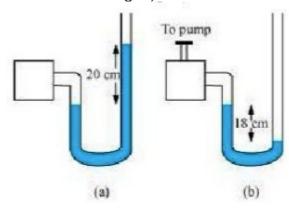

door = $\Delta P \times a = 2.744 \times 104 \times 20 \times 10 - 4 = 54.88N = 54.88N$ Therefore, the force necessary to keep the door closed

is $54.88N\Delta P = P2 - P1 = 6.664 \times 104 - 3.92 \times 104 = 2.744 \times 104 Pa$ Hence, the force exerted on the

door $=\Delta P \times a = 2.744 \times 104 \times 20 \times 10 - 4 = 54.88N = 54.88N$ Therefore, the force necessary to keep the door closed is 54.88N

Q.10.22: A manometer reads the pressure of a gas in an enclosure as shown in Fig. 10.25 (a) When a pump removes some of the gas, the manometer reads as in Fig. 10.25 (b) The liquid used in the manometers is mercury and the atmospheric pressure is 76 cm of mercury.

- (a) Give the absolute and gauge pressure of the gas in the enclosure for cases (a) and (b), in units of cm of mercury.
- (b) How would the levels change in case (b) if 13.6 cm of water (immiscible with mercury) are poured into the right limb of the manometer? (Ignore the small change in the volume of the gas).

Ans : (a) 96 cm of Hg & 20 cm of Hg; 58 cm of Hg & -18 cm of Hg (b) 19 cm

(a) For fiaure (a) Atmospheric pressure, P0=76cm of Hg Difference between the levels of mercury in the two limbs gives gauge pressure Hence, gauge pressure is 20cm of Hg. Absolute pressure = Atmospheric pressure + Gauge pressure = 76+20=96cm of Hg (a) For fiaure (a) Atmospheric pressure, P0=76cm of Hg Difference between the levels of mercury in the two limbs gives gauge pressure Hence, gauge pressure is 20cm of Hg. Absolute pressure = Atmospheric pressure + Gauge pressure = 76+20=96cm of Hg

For figure(b) Difference between the levels of mercury in the two limbs =-18cm Hence, gauge pressure is -18cm of Hg. Absolute pressure = Atmospheric pressure + Gauge

pressure =76cm-18cm=58cm For figure(b) Difference between the levels of mercury in the two limbs =-18cm Hence, gauge pressure is -18cm of Hg. Absolute pressure = Atmospheric pressure + Gauge pressure =76cm-18cm=58cm

(b) 13.6cm of water is poured into the right limb of figure (b) Relative density of mercury =13.6 Hence, a column of 13.6cmcm of water is equivalent to 1cm of mercury. Let h be the difference between the levels

of mercury in the two limbs. The pressure in the right limb is given as: (b) 13.6cm of water is poured into the right limb of figure

(b) Relative density of mercury =13.6 Hence, a column of 13.6cmcm of water is equivalent to 1cm of mercury. Let h be the difference between the levels of mercury in the two limbs. The pressure in the right limb is given as:

PR= Atmospheric pressure +1cm of Hg=76+1=77cm of Hg...(i) The mercury column will rise in the left limb. Hence, pressure in the left limb, PL=58+h Equating equations (i) and (ii), we get: PR= Atmospheric pressure +1cm of Hg=76+1=77cm of Hg...(i) The mercury column will rise in the left limb. Hence, pressure in the left limb, PL=58+h Equating equations (i) and (ii), we get:

77=58+h∴h=19cm Hence, the difference between the levels of mercury in the two limbs will be 19cm.77=58+h∴h=19cm Hence, the difference between the levels of mercury in the two limbs will be 19cm.

Q.10.23: Two vessels have the same base area but different shapes. The first vessel takes twice the volume of water that the second vessel requires to fill upto a particular common height. Is the force exerted by the water on the base of the vessel the same in the two cases? If so, why do the vessels filled with water to that same height give different readings on a weighing scale?

Ans: yes

Two vessels having the same base area have identical force and equal pressure acting

on their common base area. Since the shapes of the two vessels are different, the force

exerted on the sides of the vessels has non-zero vertical components. When these

vertical components are added, the total force on one vessel comes out to be greater

than that on the vessel. Hence, when these vessels are filled with to the same height, they give different readings

Q.10.24: During blood transfusion the needle is inserted in a vein where the gauge pressure is 2000 Pa. At what height must the blood container be placed so that blood may just enter the vein ? [Use the density of whole blood from Table 10.1]

Ans: Gauge pressure, P=2000Pa Density of whole

blood, $\rho=1.06\times103$ kgm-3 Acceleration due to gravity, g=9.8m/s2 Height of the blood container =h Pressure of the blood container, P= hpg Gauge pressure, P=2000Pa Density of whole

blood, $\rho=1.06\times103$ kgm-3 Acceleration due to gravity, g=9.8m/s2 Height of the blood container =h Pressure of the blood container, P= hpg $\therefore h=Ppg=20001.06\times103\times9.8=0.1925$ m $\therefore h=Ppg=20001.06\times103\times9.8=0.1925$ m

The blood may enter the vein if the blood container is kept at a height greater than 0.1925m, i.e., about 0.2m. The blood may enter the vein if the blood container is kept at a height greater than 0.1925m, i.e., about 0.2m.

Q.10.25: In deriving Bernoulli's equation, we equated the work done on the fluid in the tube to its change in the potential and kinetic energy. (a) What is the largest

average velocity of blood flow in an artery of diameter $2 \times 10-310-3$ m if the flow must remain laminar? (b) Do the dissipative forces become more important as the fluid velocity increases? Discuss qualitatively.

Ans: (a) 1.966m/s (b) Yes (a) Diameter of the

artery, $d=2\times10-3m$ Viscosity of blood, $\eta=2.084\times10-3Pas$ Density of

blood, ρ=1.06×103kg/m3 Reynolds' number for laminar

flow, NR=2000 The largest average velocity of blood is given

as: (a) 1.966m/s (b) Yes (a) Diameter of the

artery, $d=2\times10-3$ m Viscosity of blood, $\eta=2.084\times10-3$ Pas Density of

blood, p=1.06×103kg/m3 Reynolds' number for laminar

flow, NR=2000 The largest average velocity of blood is given as:

 $Varg=NR\eta pd=2000\times 2.084\times 10-31.06\times 103\times 2\times 10-3=1.966 m/s Varg=NR \eta pd=2000\times 2.084\times 10-31.06\times 103\times 2\times 10-3=1.966 m/s$

Therefore, the largest average velocity of blood is 1.966 m/s.

(b) As the fluid velocity increases, the dissipative forces become more important. This is

because of the rise of turbulence. Turbulent flow causes dissipative loss in a fluid.

Q.10.26: (a) What is the largest average velocity of blood flow in an artery of radius $2 \times 10-310-3m$ if the flow must remain lanimar? (b) What is the corresponding flow rate? (Take viscosity of blood to be $2.084 \times 10-310-3Pa$ s)

Ans: (a)Radius of the artery, $r=2\times10-3$ m Diameter of the

artery, $d=2\times2\times10-3m=4\times10-3m$ Viscosity of

blood, $\eta=2.084\times10-3$ Pa s Density of blood, $\rho=1.06\times103$ kg/m3 Reynolds' number for laminar flow, NR=2000 (a)Radius of the

artery, $r=2\times10-3$ m Diameter of the

artery, $d=2\times2\times10-3m=4\times10-3m$ Viscosity of

blood, $\eta=2.084\times10-3$ Pa s Density of

blood, $\rho=1.06\times103$ kg/m3 Reynolds' number for laminar flow, NR=2000 The largest average velocity of blood is given by the

relation V arg =NR η pd=2000×2.084×10-31.06×103×4×10-3=0.983m/s The largest average velocity of blood is given by the

relation V arg =NR η pd=2000×2.084×10-31.06×103×4×10-3=0.983m/s

Therefore, the largest average velocity Of blood is 0.983 m/s.

(b) Flow rate is given by the

relation: $R=\pi r 2V$ arg =3.14×(2×10-3)2×0.983=1.235×10-5m3s-1 Ther efore, the corresponding flow rate is 1.235×10-5m3s-1 (b) Flow rate is given by the

relation: R= π r2V arg =3.14×(2×10-3)2×0.983=1.235×10-5m3s-1 The refore, the corresponding flow rate is 1.235×10-5m3s-1

Q.10.27: A plane is in level flight at constant speed and each of its two wings has an area of 25 m2m2. If the speed of the air is 180 km/h over the lower wing and 234 km/h over the upper wing surface, determine the plane's mass. (Take air density to be 1 kg m-3m-3).

Ans: The area of the wings of the plane, $A=2\times25=50m2$ Speed of air over the lower wing, V1=180km/h=50m/s Speed of air over the upper wing, V2=234km/h=65m/s Density of air, $\rho=1kgm-3$ Pressure of air over

```
the lower wing =P1 Pressure of air over the lower wing =P2 The area of
the wings of the plane, A=2\times25=50m2 Speed of air over the lower
wing, V1=180km/h=50m/s Speed of air over the upper
wing, V2=234km/h=65m/s Density of air, \rho=1kgm-3 Pressure of air over
the lower wing =P1 Pressure of air over the lower wing =P2
The upward force on the plane can be obtained using Bernoull's equation
as: P1+12\rho V21=P2+12\rho V22P1-P2=12\rho (V22-V21) The upward force on
the plane can be obtained using Bernoull's equation
as: P1+12\rho V12=P2+12\rho V22P1-P2=12\rho (V22-V12)
 The upward force (F) on the plane can be calculated
as: (P1-P2)A=12\rho(V22-V21)A Using
equation (i)=12 \times 1 \times ((65)2 - (50)2) \times 50 = 43125N The upward force (F) on
the plane can be calculated as: (P1-P2)A=12p(V22-V12)A Using
equation (i)=12\times1\times((65)2-(50)2)\times50=43125N
 Using Newton's force equation, we can obtain the mass (m) of the plane
as: F=mg \cdot m=431259.8=4400.51 kg \sim 4400 kg Hence, the mass of the plane is
about 4400kg. Using Newton's force equation, we can obtain the mass (m) of
the plane as: F=mg::m=431259.8=4400.51kg~4400kg Hence, the mass
of the plane is about 4400kg.
Q.10.28: In Millikan's oil drop experiment, what is the terminal speed of an
uncharged drop of radius 2.0 \times 10-510-5 m and density 1.2 \times 103103 kg m-3m-3.
Take the viscosity of air at the temperature of the experiment to be 1.8 \times 105105 Pa
s. How much is the viscous force on the drop at that speed? Neglect buoyancy of
the drop due to air
Ans: Terminal speed =5.8cm/s; Viscous force =3.9 \times 10 - 10N Radius of
the given uncharged drop, r=2.0\times10-5m Density of the uncharged
drop, \rho=1.2\times103kgm-3 viscosity of air, \eta=1.8\times10-5Pa s Terminal
speed =5.8cm/s; Viscous force =3.9 \times 10 - 10N Radius of the given
uncharged drop, r=2.0\times10-5m Density of the uncharged
drop, \rho=1.2\times103kgm-3 viscosity of air, n=1.8\times10-5Pa s
 Density of air (po) can be taken as zero in order to neglect buoyancy of
air. Acceleration due to gravity, g=9.8m/s2 Terminal velocity (v) is given
by the relation: Density of air (po) can be taken as zero in order to
neglect buoyancy of air. Acceleration due to gravity, g=9.8m/s2 Terminal
velocity (v) is given by the relation:
v=2r2\times(\rho-\rho 0)g9\eta=2\times(2.0\times10-5)2(1.2\times103-0)\times9.89\times1.8\times10-3=5.80
7 \times 10 - 2 \text{ms} - 1 = 5.8 \text{cms} - 1 \text{v} = 2 \text{r} 2 \times (\rho - \rho 0) \text{g} 9 \text{n} = 2 \times (2.0 \times 10 - 5) 2 (1.2 \times 103 - 1) = 2 \times (2.0 \times 10 - 5) 2 (1.2 \times 103 - 1) = 2 \times (2.0 \times 10 - 5) 2 (1.2 \times 103 - 1) = 2 \times (2.0 \times 10 - 5) 2 (1.2 \times 103 - 1) = 2 \times (2.0 \times 10 - 5) 2 (1.2 \times 103 - 1) = 2 \times (2.0 \times 10 - 5) 2 (1.2 \times 103 - 1) = 2 \times (2.0 \times 10 - 5) 2 (1.2 \times 103 - 1) = 2 \times (2.0 \times 10 - 5) 2 (1.2 \times 103 - 1) = 2 \times (2.0 \times 10 - 5) 2 (1.2 \times 103 - 1) = 2 \times (2.0 \times 10 - 5) 2 (1.2 \times 103 - 1) = 2 \times (2.0 \times 10 - 5) 2 (1.2 \times 103 - 1) = 2 \times (2.0 \times 10 - 5) 2 (1.2 \times 103 - 1) = 2 \times (2.0 \times 10 - 5) 2 (1.2 \times 103 - 1) = 2 \times (2.0 \times 10 - 5) 2 (1.2 \times 103 - 1) = 2 \times (2.0 \times 10 - 5) 2 (1.2 \times 103 - 1) = 2 \times (2.0 \times 10 - 5) 2 (1.2 \times 103 - 1) = 2 \times (2.0 \times 10 - 5) 2 (1.2 \times 103 - 1) = 2 \times (2.0 \times 10 - 5) 2 (1.2 \times 103 - 1) = 2 \times (2.0 \times 10 - 5) 2 (1.2 \times 103 - 1) = 2 \times (2.0 \times 10 - 5) 2 (1.2 \times 103 - 1) = 2 \times (2.0 \times 10 - 5) 2 (1.2 \times 103 - 1) = 2 \times (2.0 \times 10 - 5) 2 (1.2 \times 103 - 1) = 2 \times (2.0 \times 10 - 5) 2 (1.2 \times 103 - 1) = 2 \times (2.0 \times 10 - 5) 2 (1.2 \times 103 - 1) = 2 \times (2.0 \times 10 - 5) 2 (1.2 \times 103 - 1) = 2 \times (2.0 \times 10 - 5) 2 (1.2 \times 103 - 1) = 2 \times (2.0 \times 10 - 5) 2 (1.2 \times 103 - 1) = 2 \times (2.0 \times 10 - 5) 2 (1.2 \times 103 - 1) = 2 \times (2.0 \times 10 - 5) 2 (1.2 \times 103 - 1) = 2 \times (2.0 \times 10 - 5) 2 (1.2 \times 103 - 1) = 2 \times (2.0 \times 10 - 5) 2 (1.2 \times 103 - 1) = 2 \times (2.0 \times 10 - 5) 2 (1.2 \times 103 - 1) = 2 \times (2.0 \times 10 - 5) 2 (1.2 \times 103 - 1) = 2 \times (2.0 \times 10 - 5) 2 (1.2 \times 103 - 1) = 2 \times (2.0 \times 10 - 5) 2 (1.2 \times 103 - 1) = 2 \times (2.0 \times 103 - 1) = 2 \times (
0)\times9.89\times1.8\times10-3=5.807\times10-2ms-1=5.8cms-1
 Hence, the terminal speed of the drop is 5.8cms-1. The viscous force on
the drop is given
by: F = 6\pi \eta rv. F = 6 \times 3.14 \times 1.8 \times 10 - 5 \times 2.0 \times 10 - 5 \times 5.8 \times 10 - 2 = 3.9 \times 10 - 10N
Hence, the viscous force on the drop is 3.9 \times 10 - 10N. Hence, the
terminal speed of the drop is 5.8 \text{cms} - 1. The viscous force on the drop is
aiven
by: F=6\pi\eta rv.: F=6\times3.14\times1.8\times10-5\times2.0\times10-5\times5.8\times10-2=3.9\times10-10N
Hence, the viscous force on the drop is 3.9 \times 10 - 10N.
```

Q.10.29: Mercury has an angle of contact equal to 140° with soda lime glass. A narrow tube of radius 1.00 mm made of this glass is dipped in a trough containing

mercury. By what amount does the mercury dip down in the tube relative to the liquid surface outside? Surface tension of mercury at the temperature of the experiment is 0.465 N m-1m-1. Density of mercury = $13.6 \times 103103 \text{ kg m-3m-3}$.

Ans: Angle of contact between mercury and soda lime glass, θ =140° Radius of the narrow tube, r=1mm=1×10-3m Surface tension of mercury at the given temperature, s=0.465Nm-1 Density of mercury, ρ =13.6×103kg/m3 Dip in the height of mercury = \hbar Angle of contact between mercury and soda lime glass, θ =140° Radius of the narrow tube, r=1mm=1×10-3m Surface tension of mercury at the given temperature, s=0.465Nm-1 Density of mercury, ρ =13.6×103kg/m3 Dip in the height of mercury = \hbar

Acceleration due to gravity, g=9.8m/s2 Surface tension is related with the angle of contact and the dip in the height

as: s=hpgr2cosθ∴h=2scosθrpg Acceleration due to

gravity, g=9.8m/s2 Surface tension is related with the angle of contact and the dip in the height as: $s=hpgr2cos\theta$: $h=2scos\theta rpg$

 \therefore h=2scos θ rpg=2×0.465×cos1401×10-3×13.6×103×9.8 \therefore h=2scos θ rpg=2×0.465×cos1401×10-3×13.6×103×9.8

=-0.00534m=-5.34mm=-0.00534m=-5.34mm

Here, the negative sign shows the decreasing level of mercury. Hence, the mercury level dips by 5.34 mm.

Q.10.30: Two narrow bores of diameters 3.0 mm and 6.0 mm are joined together to form a U-tube open at both ends. If the U-tube contains water, what is the difference in its levels in the two limbs of the tube? Surface tension of water at the temperature of the experiment is $7.3 \times 10-210-2$ N m-1m-1. Take the angle of contact to be zero and density of water to be 1.0×103103 kg m-3m-3 (g = 9.8 m s-2s-2).

Ans: Diameter of the first bore, d1=3.0mm= $3\times10-3$ m Hence, the radius of the first bore, $r1=d12=1.5\times10-3$ m Diameter of the second bore, d2=6.0mm Hence, the radius of the second

bore, $r2=d22=^3\times 10-3m$ Diameter of the first

bore, d1=3.0mm $=3\times10-3$ m Hence, the radius of the first

bore, $r1=d12=1.5\times10-3m$ Diameter of the second

bore, d2=6.0mm Hence, the radius of the second

bore, $r2=d22=3^{10}-3m$

Surface tension of water, $s=7.3\times10-2Nm-1$ Angle of contact between the bore surface and water, $\theta=0$ Density of

water, $\rho=1.0\times103$ kg/m-3 Acceleration due to

gravity, g=9.8m/s2 Let h1 and h2 be the heights to which water rises in the first and second tubes respectively. These heights are given by the relations: Surface tension of water, $s=7.3\times10-2Nm-1$ Angle of contact between the bore surface and water, $\theta=0$ Density of

water, $\rho=1.0\times103$ kg/m-3 Acceleration due to

gravity, g=9.8m/s2 Let h1 and h2 be the heights to which water rises in the first and second tubes respectively. These heights are given by the relations:

h1=2scos θ r1pgh2=2xcos θ r2pgh1=2scos θ r1pgh2=2xcos θ r2pg The difference between the levels of water in the two limbs of the tube can be calculated as: =2scos θ r1pg-2scos θ r2pg=2scos θ pg[1r1-1r2] The

```
difference between the levels of water in the two limbs of the tube can be
calculated as: =2scos\theta r1pq - 2scos\theta r2pq = 2scos\theta pq[1r1-1r2]
=2scos\theta pq[1ri-1r2]=2\times7.3\times10-2\times11\times103\times9.8[11.5\times10-3-13\times10-3]
=4.966\times10-3m=4.97mm=2scos\theta pg[1ri-1r2]=2\times7.3\times10-2\times11\times103\times9
.8[11.5 \times 10 - 3 - 13 \times 10 - 3] = 4.966 \times 10 - 3m = 4.97mm
Hence, the difference between levels of water in the two bores is 4.97
mm.
Q.10.31: (a) It is known that density \rho of air decreases with height v as 0 v/vo e - \rho =
\rho where \rho 0 = 1.25 kg m-3m-3 is the density at sea level, and v = 0 is a constant. This
density variation is called the law of atmospheres. Obtain this law assuming that the
temperature of atmosphere remains a constant (isothermal conditions). Also assume
that the value of g remains constant. (b) A large He balloon of volume 1425 m3m3 is
used to lift a payload of 400 kg. Assume that the balloon maintains constant radius
as it rises. How high does it rise? [Take y0 = 8000 \text{ m} and pHe = 0.18 \text{ kg m} - 3\text{m} - 3].
Ans: (a) Volume of the balloon, V=1425m3 Mass of the
payload, m=400kg Acceleration due to gravity, g=9.8m/s2 (a) Volume of
the balloon, V=1425m3 Mass of the payload, m=400kg Acceleration due
to gravity, q=9.8m/s2
y0=8000mplk=0.18kgm-3pb=1.25kg/m3 Density of the
balloon = \rho Height to which the balloon rises = \gamma Density (\rho) of air
decreases with
height (y) as: y0=8000mplk=0.18kgm-3pb=1.25kg/m3 Density of the
balloon = \rho Height to which the balloon rises = \gamma Density (\rho) of air
decreases with height (y) as:
\rho = \rho 0 = -y/y 0 \rho \rho 0 = e - yf 0 This density variation is called the law of
atmospherics. \rho = \rho 0 e^{-y/y} 0 \rho \rho 0 = e^{-y} f 0 This density variation is called the
law of atmospherics.
It can be inferred from equation (i) that the rate of decrease of density
with height is directly proportional to ρ, i.e., It can be inferred from
equation (i) that the rate of decrease of density with height is directly
proportional to ρ, i.e.,
-dρdy∝ρdρdy=-kρdρρ=-kdy Where, k is the constant of
proportionality −dpdy∝pdpdy=−kpdpp=−kdy Where, k is the constant of
proportionality
Height changes from 0 to y, while density changes
from \rho oto \rho. Integrating the sides between these limits, we get: Height
changes from 0 to y, while density changes from p oto p. Integrating the
sides between these limits, we get:
\int \rho \mu d\rho \rho = -\int y 0 k dy \int \mu \rho d\rho \rho = -\int 0 y k dy
[logcp]pnn=-ky[logcp]nnp=-ky
\log \exp 0 = -ky \exp 0 = e - ky \log \exp 0 = -ky \exp 0 = e - ky
Comparing equations (i) and (ii), we get: y0=1kk=1y0 Comparing
equations (i) and (ii), we get: y0=1kk=1y0
From equations (i) and (iii), we get: \rho = \rho 0e - y/y0 (b) From
equations (i) and (iii), we get: \rho = \rho 0e - y/y0 (b)
Density \rho= Mass Volume = Mass of the payload + Mass of
helium Volume = m+Vp he V=400+1425\times0.181425=0.46kg/m2 Density
```

```
p= Mass Volume = Mass of the payload + Mass of helium Volume =m+Vp he V=400+1425\times0.181425=0.46kg/m2 From equations (ij) and (iii), we can obtain y as p=p0e-y/yn From equations (ij) and (iii), we can obtain y as p=p0e-y/yn logdpp0=-yy0:y=-8000\timesloge0.461.25logdpp0=-yy0:y=-8000\timesloge0.461.25 =-8000\times-1=8000m=8km=-8000\times-1=8000m=8km Hence, the balloon will rise to a height of 8 km.
```
