1.	Find: $\int \frac{\log x}{(1+\log x)^2} dx$ Solution: $\int \frac{\log x}{(1+\log x)^2} dx = \int \frac{\log x+1-1}{(1+\log x)^2} dx = \int \frac{1}{1+\log x} dx - \int \frac{1}{(1+\log x)^2} dx$ $= \frac{1}{1+\log x} \times x - \int \frac{-1}{(1+\log x)^2} \times \frac{1}{x} \times x dx - \int \frac{1}{(1+\log x)^2} dx = \frac{x}{1+\log x} + c$ OR	1/2 1+1/2	
	Find: $\int \frac{\sin 2x}{\sqrt{9 - \cos^4 x}} dx$ Solution: Put $\cos^2 x = t \Rightarrow -2\cos x \sin x dx = dt \Rightarrow \sin 2x dx = -dt$	1	
2.	The given integral $= -\int \frac{dt}{\sqrt{3^2 - t^2}} = -\sin^{-1}\frac{t}{3} + c = -\sin^{-1}\frac{\cos^2 x}{3} + c$ Write the sum of the order and the degree of the following differential equation: $\frac{d}{dx}\left(\frac{dy}{dx}\right) = 5$ Solution: Order = 2 Degree = 1 Sum = 3	1 1/2 ½	
3.	If $\hat{a}$ and $\hat{b}$ are unit vectors, then prove that $ \hat{a} + \hat{b}  = 2\cos\frac{\theta}{2}$ , where $\theta$ is the angle between them. Solution: $(\hat{a} + \hat{b}).(\hat{a} + \hat{b}) =  \hat{a} ^2 +  \hat{b} ^2 + 2(\hat{a}.\hat{b})$ $ \hat{a} + \hat{b} ^2 = 1 + 1 + 2\cos\theta$ $= 2(1 + \cos\theta) = 4\cos^2\frac{\theta}{2}$ $\therefore  \hat{a} + \hat{b}  = 2\cos\frac{\theta}{2}$ ,	1 1/2 ½	
4.	Find the direction cosines of the following line: $\frac{3-x}{-1} = \frac{2y-1}{2} = \frac{z}{4}$ Solution: The given line is $\frac{x-3}{1} = \frac{y-\frac{1}{2}}{1} = \frac{z}{4}$ Its direction ratios are <1, 1, 4> Its direction cosines are $\langle \frac{1}{3\sqrt{2}}, \frac{1}{3\sqrt{2}}, \frac{4}{3\sqrt{2}} \rangle$	1 1/2 ½	

5.	5. A bag contains 1 red and 3 white balls. Find the probability distribution of the number of red balls if 2 balls are drawn at random from the bag one-by-one without replacement. Solution: Let X be the random variable defined as the number of red balls.			
	Then X = 0, 1			1/2 1/2
	$P(X=0) = \frac{3}{4} \times \frac{2}{3} = \frac{6}{12} = \frac{1}{2}$ $P(X=1) = \frac{1}{4} \times \frac{3}{3} + \frac{3}{4} \times \frac{1}{3} = \frac{6}{12} = \frac{1}{2}$ Probability Distribution Table:		1/2

13.	Find the foot of the perpendicular from the point $(1, 2, 0)$ upon the plane $x - 3y + 2z = 9$ . Hence, find the distance of the point $(1, 2, 0)$ from the given	
	x = 3y + 2z = 9. Thence, find the distance of the point (1, 2, 0) from the given plane.	
	Solution: The equation of the line perpendicular to the plane and passing	
	through the point (1, 2, 0) is $x-1$ $y-2$ z	1
	$\frac{x}{1} = \frac{y}{-3} = \frac{z}{2}$	
	The coordinates of the foot of the perpendicular are $(\mu + 1, -3\mu + 2, 2\mu)$ for	1⁄2
	some $\mu$ These coordinates will satisfy the equation of the plane. Hence, we have	
	$\mu + 1 - 3(-3\mu + 2) + 2(2\mu) = 9$	
	$\Rightarrow \mu = 1$	1
	The foot of the perpendicular is $(2, -1, 2)$ .	1⁄2 1
	Hence, the required distance = $\sqrt{(1-2)^2 + (2+1)^2 + (0-2)^2} = \sqrt{14}$ units

	An insurance company believes that people can be divided into two classes: those	e who are
	accident prone and those who are not. The company's statistics show that an accid	ent-prone
	person will have an accident at sometime within a fixed one-year period with prob	ability 0.6,
	whereas this probability is 0.2 for a person who is not accident prone. The company k	nows that
	20 percent of the population is accident prone.	
	Based on the given information, answer the following questions.	
	(i)what is the probability that a new policyholder will have an accident within a	
	year of purchasing a policy?	
	(ii) Suppose that a new policyholder has an accident within a year of purchasing a policy. What is the probability that he or she is accident prone?	
	Solution: Let $E_1$ = The policy holder is accident prone.	
	$E_2$ = The policy holder is not accident prone.	
	E = The new policy holder has an accident within a year of purchasing a

	(i) $P(E) = P(E_1) \times P(E/E_1) + P(E_2) \times P(E/E_2)$ $= \frac{20}{100} \times \frac{6}{10} + \frac{80}{100} \times \frac{2}{10} = \frac{7}{25}$	1
	$= \frac{1}{100} \times \frac{1}{10} + \frac{1}{100} \times \frac{1}{10} = \frac{1}{25}$	
	(ii) By Bayes' Theorem, $P(E_1/E) = \frac{P(E_1) \times P(E/E_1)}{P(E)}$	1
	$=\frac{\frac{20}{100}\times\frac{6}{10}}{\frac{280}{7}}=\frac{3}{7}$	1
